

PRODUCT OVERVIEW · VERSION 1

FloBama OS

The internal operations platform for FloBama Music Hall — events, artists, public listings, screens, ticketing, booking, and social — so staff can run the room without touching the public website stack.

Venue

FloBama Music Hall ·
America/Chicago

Stack

Next.js · Supabase · GHL ·
OpenAI

Production

flobama-os.vercel.app

Audience

Admin / Manager / Viewer

Events

Calendar, publish, sheet sync

Screens

LED wall + vertical TVs

Tickets

GA, VIP, tables, door QR

Booking

GHL inbox + band-fit AI

What V1 is

FloBama OS is a single Next.js App Router application with a Supabase Postgres backend. Staff authenticate with email/password; roles are venue-scoped and enforced in both server actions and row-level security. Public consumers never read internal event rows — they hit projection views and a versioned JSON API.

The product deliberately does *not* edit flobamadowntown.com, Pick'em, or other production sites. WordPress embeds, OBS overlays, and kiosk displays consume FloBama OS as the source of truth for listings and screens.

In this document

- Product modules & staff roles
- Architecture & data flow
- External APIs and how they are used
- Database layout diagrams
- Ticketing & screens runtime flows
- Public surface endpoints

Features by module

Everything lives in one staff app. Modules share the venue record, timezone, and role matrix.

Dashboard & Events

- Today overlap, 7-day count, drafts, attention queue
- Create / edit / duplicate / publish / archive
- Ticketed flag, ticket URL, cover labels
- Events → Update syncs master Google Sheet by legacy_source_id (idempotent)

Artists

- Directory: search, create, edit, archive
- Linked upcoming and past events
- Genre, bio, website
- Karaoke import does not invent a Karaoke artist

Public listings

- JSON API with CORS * on GET
- HTML embed + iframe resizer for WordPress
- OBS overlay at 1920×1080
- Internal notes stay staff-only

Screens

- LED wall: OBS WebSocket v5 Ads vs Band
- Vertical 1080×1920 playlist + this-week slide
- Timed takeovers
- Weekly flyer & social graphic exports

Ticketing

- GA / VIP, whole-table reservations, guest checkout
- 10-minute holds; conditional table inventory
- QR passes + door check-in
- Mock payments in V1 (Stripe reserved)

Booking & Social

- GHL Band Submission & Private Events inbox
- GHL remains source of truth (not copied to DB)
- OpenAI booking-fit advisory
- GHL Social Planner for weekly graphics

Staff roles

Admin

Full control — staff, venue rename, events, screens, ticketing, booking, social

Manager

Day-to-day ops — events, artists, screens, ticketing (no staff admin)

Viewer

Read-only calendar, artists, staff directory, sales views

No public signup. First admin is bootstrapped in SQL; later logins via Settings → Staff. Master admin zak@view360.marketing cannot be removed or demoted by other staff.

How the app works

Figure 1 — Runtime topology: staff UI, public surfaces, Supabase, and third-party APIs

Request paths

Surface	Auth	Data path
Staff pages / server actions	Cookie session + membership role	Authenticated client → tables under RLS; service role only for creating logins
/api/public/v1/*	Anonymous (CORS * on GET)	Anon client → event_listings / screen views / ticketing public handlers
Booking / Social	Staff session + GHL PIT	Server fetches GHL; records are not copied into Postgres
OBS LED wall	Staff session on booth PC	OBS credentials in sessionStorage; scenes driven by /now + takeover state

APIs used — and how

V1 leans on a small set of external services. Secrets are server-only unless noted.

API / service	Used for	How FloBama OS calls it
Supabase Auth · Postgres · Storage	Identity, operational data, screen-ad files	@supabase/ssr cookie sessions; anon key for public views; service role for staff creation; screen-ads storage bucket
GoHighLevel leadconnectorhq.com	Band submissions, private events, Social Planner	Private Integration Token + location id. Custom objects; associations → contacts; Social Planner posts for weekly graphics
OpenAI	Advisory band booking-fit scores	Server chat completion (default gpt-4.1-mini) from GHL Band Inquiry fields only — no live scraping; never writes status to GHL
Google Sheets published CSV	Master calendar import	Events → Update fetches published FloBama sheet CSV, upserts by legacy_source_id, withdraws unpublished/archived rows
OBS WebSocket v5	LED wall scene cutting	obs-websocket-js from the booth browser; credentials never stored in DB or git
Stripe (reserved)	Future card checkout	V1 uses a labeled mock payment adapter; live Stripe key without wiring refuses charges

Public HTTP API (owned by FloBama OS)

Endpoint	Purpose
GET /api/public/v1/events	Upcoming public listings (from, to, limit)
GET /api/public/v1/events/[id]	Single public event detail
GET /api/public/v1/now	Today's overlapping shows + booth now-playing
GET /api/public/v1/screens/vertical	Vertical TV playlist JSON (kiosks poll)
GET /api/public/v1/screens/week	This week's events for the live slide
GET /api/public/v1/screens/week/social	Social graphic render helper
POST /api/public/v1/ticketing/hold	Hold GA qty / tables (~10 min)
POST /api/public/v1/ticketing/checkout	Guest checkout → order + QR tickets
GET /api/public/v1/ticketing/events/[id]	Public ticketed event catalog + map
GET /api/public/v1/ticketing/tickets/[token]	Resolve ticket pass by QR token

GHL booking call pattern: 1) List custom object records → 2) GET /associations/relations/{recordId} → 3) GET /contacts/{id} → 4) OpenAI fit note from inquiry fields only.

Database layout

Single venue seed. Timezone locked to America/Chicago. Anon is the only user. All tables are internal tables.

Figure 2 — Core schema: membership, events/artists, and public projection views

Security highlights

- RLS forced on operational tables
- Anon: no SELECT on events
- Public consumers use security-definer views
- Ticketing PII is staff-only

Key enums

- staff_role: admin · manager · viewer
- event_status: draft · published · cancelled
- event_visibility: public · private
- event_type: live_music · karaoke · dj · sports · private_event · other

DATA MODEL

Figure 3 — Ticketing: master layout → event snapshot → holds → orders → QR tickets

Figure 4 — Screens tables: LED wall config, ad playlist, takeovers, and storage

How key flows run

Public listing → website & booth

Figure 5 — Publishing fans out through views to embed, API, overlay, and LED automation

Ticketing purchase path

Vertical screens loop

Table inventory uses conditional updates (UPDATE ... WHERE status = 'available') so two buyers cannot claim the same table. Enabling Ticketing copies the FloBama main-room layout onto that show only.

SUMMARY

V1 at a glance

One staff OS for FloBama Music Hall — calendar through door scan — with a clean public edge.

Shipped in V1

- Role-based staff OS (admin / manager / viewer)
- Events + artists with sheet sync
- Public API, embed, OBS overlay
- LED wall + vertical screens + flyer/social exports
- Native ticketing with QR door check-in
- GHL booking inbox + OpenAI fit notes
- GHL Social Planner for weekly posts

Explicitly out of scope

- Editing flobamadowntown.com or Pick'em
- SpotOn / sales reporting
- Inventory, payroll, multi-venue UI
- Recurring events, per-TV playlists
- Public self-registration
- Live Stripe charges (mock until wired)
